After a long wait, Paul    announced    the beta release of cfcUnit 1.2, which now finally includes Ant support. cfcUnit allows you to perform tests on very specific functionality of your components (units), and now they can be funny automated with your builds by being invoked by Ant right from within Eclipse. I know Paul has been working on this for a long time under Sean's pressure, so you know this code must be good. You can get the latest release at    sourceforge   .
